APPENDIX F

DRINKING WATER AND WASTEWATER CONVEYANCE DESIGN AND ASSET LIST

POINT GREY
WATER AND WASTEWATER
CONVEYANCE SYSTEMS
TABEC PTY LTD
NOVEMBER 2010

CONTENTS

1.0 INTRODUCTION

This report has been prepared by Tabec Pty Ltd at the request of Point Grey Development Company to discuss the infrastructure required for conveyance of fresh (potable) water and wastewater at the proposed Point Grey subdivision development in Shire of Murray. Included in the report are estimates of the supply and installation cost and the annual maintenance costs.

The conveyance system does not include any water extraction or treatment facilities or any infrastructure to be installed by future home builders on privately owned lots.

2.0 FRESH (POTABLE) WATER CONVEYANCE

The fresh water supply system will be designed in accordance with Water Supply Code of Australia published by Water Services Association of Australia. Where possible or appropriate, standards consistent with Water Corporation assets installed in Western Australia will be utilised.

A concept layout for the system has been prepared to a level sufficient to determine broad pipe sizing and furniture including valves, hydrants and property connections. The system as designed assumes a water supply point located midway along the southern boundary of the Point Grey Development Company landholding.

Based on preliminary supply demand requirements, the water supply conveyance network will consist of pipework ranging from 250mm diameter PVC down to 100mm diameter PVC. The design life of the pipework is 100 years and the pipework furniture has a design life of 30 years. These are consistent with the requirements of Water Services Association of Australia. The system layout will include predominantly loop mains to minimise the number of customers affected in the event of damage or rupture to the pipe network. Hydrant spacing will be in accordance with requirements set out by Fire and Emergency Services

It is proposed that the infrastructure will be installed in a ‘common services trench’ within road reserves in a corridor 1.8m to 2.4m (nominally 2.1m) from the road reserve boundaries. This alignment is consistent Water Corporation water supply service infrastructure. Services to share the common trench are likely to include power, communications, gas and non-potable water. Design and installation standards are provided as Appendix 1 to this document.

Based on the concept layout, Tabec have prepared cost estimates for the supply and installation and for maintenance associated with the freshwater conveyance system. The total installation cost is estimated to be $5,250,550 plus GST which equates to approximately $1,860 plus GST per lot. Maintenance of the system is allowed for at a budgeted cost of $113,590 plus GST per annum. The maintenance costs allow for a

number of pipe breakages and for periodic replacement of defective valves and hydrants. There is no allowance for scheduled replacement of pipework or furniture. A breakdown of the supply and installation and the maintenance of the fresh water conveyance infrastructure is included as Appendix 2.

3.0 WASTEWATER CONVEYANCE

The wastewater system will be designed and installed to a standard consistent with the requirements of Water Corporation of Western Australia.

Sewer catchment planning has highlighted that the site could be serviced with 3 or 4 sewer catchments. Catchment boundaries are determined by both the topography and the depth of gravity sewers. To minimise the length of deep sewers and deeper pump stations that would require significant dewatering (and associated environmental issues), Tabec recommend that Point Grey be divided into 4 sewer catchments. Three of the 4 catchments would discharge directly to the wastewater treatment facility located within the southern portion of the proposed development. The remaining northern most catchment would discharge into the eastern catchment.

The eastern catchment is the largest catchment of the four and in addition to the direct gravity flow, it would receive a pumped flow from the northern catchment. Sewer pipe depths within the catchment are up to approximately 5.0m deep with invert levels of the deepest pipe at approximately -2.5mAHD. A type 40 sewer pumping station with associated emergency storage to minimise overflow to the environment in the event of system failure is planned for this catchment. The gravity flow to the pump station is approximately 15.9 litres per second and the pumped flow from the northern catchment is approximately 7.9 litres per second. The pumped flow from the eastern catchment is expected to be in the order of 31.8 litres per second which discharges to the proposed treatment facility through an approximate 1,050m long, 150mm diameter pressure main.

The northern catchment at the peninsula of Point Grey has pipe depths up to 5.5m and deepest gravity sewer levels of approximately -2.0m AHD. A type 10 sewer pumping station with associated emergency storage to minimise overflow to the environment in the event of system failure is planned for this catchment. The gravity flow to the pump station is approximately 5.3 litres per second. The pumped flow from the pump station is estimated to be 7.9 litres per second which discharges to the eastern catchment through an approximate 650m long 100mm diameter pressure main.

The western catchment envelopes the proposed future marina with pipe depths up to 4.5m and deepest gravity sewer levels of approximately -1.5m AHD. A type 10 sewer pumping station with associated emergency storage to minimise overflow to the environment in the event of system failure is planned for this catchment. The gravity flow to the pump station is approximately 9.2 litres per second. The pumped flow from the

pump station is estimated to be 13.9 litres per second which discharges to the proposed treatment facility through an approximate 1,100m long 100mm diameter pressure main.

The south-western catchment is predominantly outside Point Grey Development Company's landholding and has pipe depths up to 5.0m and deepest gravity sewer levels of approximately -0.5m AHD. A type 10 sewer pumping station with associated emergency storage to minimise overflow to the environment in the event of system failure is planned for this catchment. The gravity flow to the pump station is approximately 4.5 litres per second. The pumped flow from the pump station is estimated to be 6.7 litres per second which discharges to the proposed treatment facility through an approximate 1,050m long 100mm diameter pressure main.

The majority of the gravity sewer network within the catchments will consist of 150mm PVC sewer grade pipe. 225mm diameter PVC pipework will be utilised when the design flows exceed 6 litres per second. Pipeline gradients will be consistent with Water Corporation criteria. Junctions of sewer pipe will be accommodated with the use of Water Corporation Types 1 and 8 pits and with inspection shaft connections. All single residential properties within the catchment will be provided with a 100mm diameter sewer junction at a depth that will allow connection of internal plumbing in accordance with relevant Australian codes and building practice. Design and installation standards are provided as Appendix 3 to this document.

Based on the concept layout, Tabec have prepared cost estimates for the supply and installation and for maintenance associated with the wastewater conveyance system. The total installation cost is estimated to be $13,778,550 plus GST which equates to approximately $4,640 plus GST per lot. Maintenance of the system is allowed for at a budgeted cost of $252,695 plus GST per annum. The maintenance costs allow for repairs / replacement of damaged pit covers, intermittent repairs to damaged pipework and the operation and maintenance of the sewer pumping stations. The operational costs include power consumption, scheduled replacement of pumps and regular maintenance inspections and repairs. There is no allowance for scheduled replacement of pipework or furniture. A breakdown of the supply and installation and the maintenance of the fresh water conveyance infrastructure is included as Appendix 4.

4.0 MAINTENANCE

Point Grey Development Company propose to contract out the maintenance works associated with the conveyance infrastructure to suitable experienced contractors with an established presence in the Peel Region.

Maintenance works will include remote daily monitoring of sewer pump station performance, regular on-site monitoring of the sewer pumping stations and scheduled replacement of pump station infrastructure including pumpsets and wearing components.

Should the pumping station alarms highlight that pumps are not operating, the contractor would ensure that the pumps become operational, or arrange for temporary tankering to minimise the chance of discharge of sewer to the environment.

The appointed contractor will also respond to emergency calls in relation to damaged infrastructure or for any leaks or overflows within the systems.

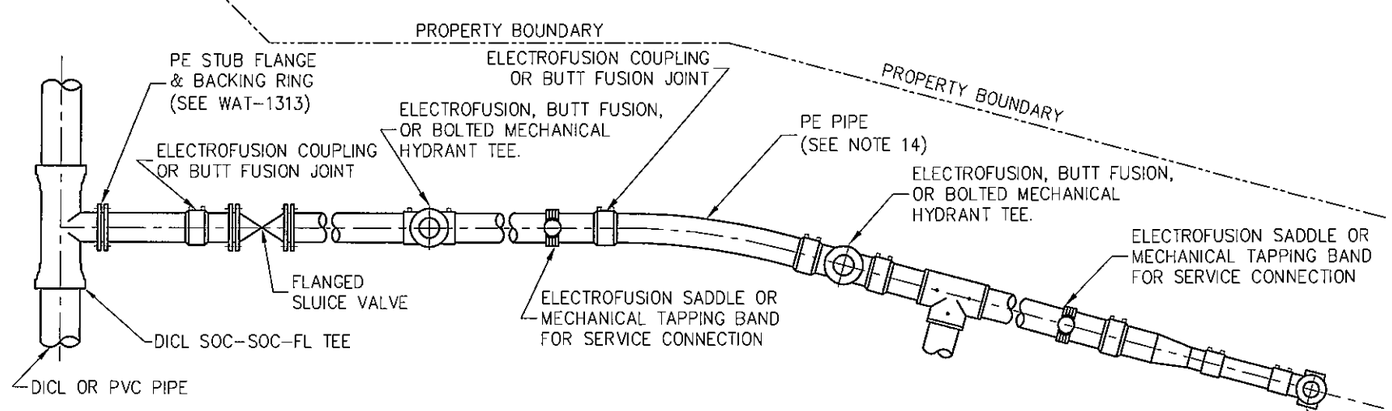
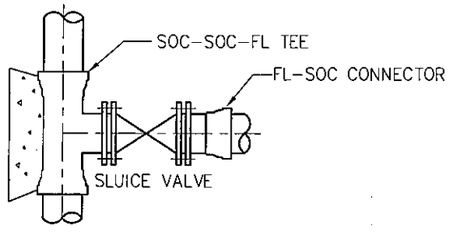
TYPICAL INSTALLATION OF PVC & DI PIPES & FITTINGS



TYPICAL INSTALLATION OF PE PIPES & FITTINGS



TYPICAL VALVE CONNECTION DIRECT TO NEW MAIN

NOTES:

1. ALL DIMENSIONS IN MILLIMETRES.
2. INSTALL PIPEWORK PARALLEL TO PROPERTY BOUNDARIES.
3. STAINLESS STEEL AND FBE COATED TAPPING BANDS DO NOT REQUIRE ADDITIONAL CORROSION PROTECTION.
4. WRAP BOLTED CONNECTIONS USING OTHER THAN FBE COATED FITTINGS AND STAINLESS STEEL BOLTS WITH A PETROLATUM TAPE SYSTEM IN ACCORDANCE WITH WAT–1313.

DI & PVC PIPE

5. DUCTILE IRON FITTINGS MAY BE USED WITH DI & PVC PIPE. FITTINGS MAY BE FBE COATED AND LINED OR CEMENT LINED WITH A BITUMINOUS EXTERNAL COATING. DO NOT USE PVC FITTINGS WITH DI PIPE.
6. PE SLEEVING REQUIRED ON ALL BITUMINOUS COATED DI PIPE AND FITTINGS APPLIED IN ACCORDANCE WITH AS 3681. TWO THICKNESSES REQUIRED BETWEEN FITTINGS AND THRUST BLOCK. REINSTATE ANY DAMAGED SLEEVING AS PER MANUFACTURER'S SPECIFICATIONS.
7. USE PRE–TAPPED CONNECTORS ON DN 100 & DN 150 NEW MAIN INSTALLATIONS (UNLESS SPECIFIED OTHERWISE BY THE WATER AGENCY).
8. USE TAPPING BANDS FOR CONNECTIONS TO EXISTING MAINS AND NEW MAINS >DN 150.
9. ELECTRICALLY ISOLATE COPPER SERVICES FROM DICL PIPE.

PVC PIPE

10. TAPPING BANDS ON PVC PIPE TO BE FULL CIRCLE CLAMPING.
11. WHERE PVC FITTINGS ARE USED, A PROTECTIVE MEMBRANE IS REQUIRED BETWEEN FITTING AND THRUST BLOCK. PVC FITTINGS TO BE USED ONLY ON PVC PIPE. DI SPIGOTS NOT TO BE INSERTED INTO PVC SOCKETS.
12. MAXIMUM SIZE OF DRILLED HOLES FOR SERVICE CONNECTIONS IN PVC PIPE TO BE 30% DN OR 50 (LOWER VALUE TO BE USED) LARGER HOLES CAN BE USED FOR UNDER PRESSURE TAPPING.

DI PIPE

13. DIRECT TAPPING OF >DN 200 DICL MAY BE AUTHORISED BY WATER AGENCIES.

PE PIPE

14. PE PIPE MAY BE COLD BENT TO MINIMUM RADIUS OF 25 x (OD), STAKES OR OTHER SOURCES OF POINT LOADS SHALL NOT BE USED TO ASSIST IN BENDING THE PIPE.
15. MAKE ALLOWANCE DURING CONSTRUCTION FOR EXPANSION AND CONTRACTION OF PE PIPE DUE TO TEMPERATURE CHANGES.
16. BUTT WELDING IN ACCORDANCE WITH WSA–01 (POLYETHYLENE CODE). BUTT WELDING IN TRENCHES IS NOT PERMITTED.
17. ALL MECHANICAL COUPLINGS TO BE SELF–RESTRAINING.

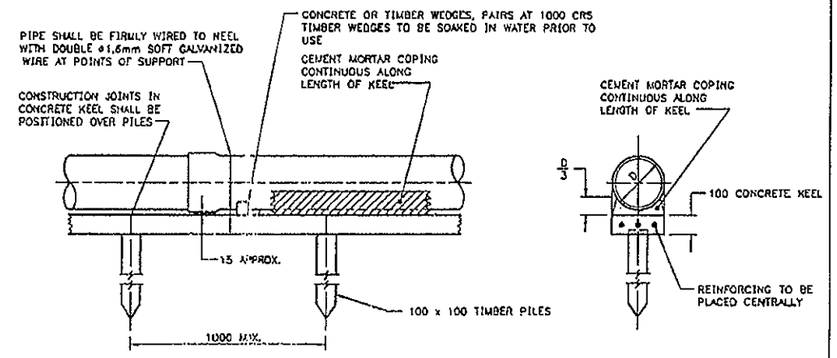
GENERAL NOTES :

1. ALL DIMENSIONS ARE IN MILLIMETRES UNLESS SHOWN OTHERWISE.
2. THESE BEDDING CONDITIONS ARE APPLICABLE TO DN100 TO DN375 SEWERS. PVC PIPES AND FITTINGS SHALL BE IN ACCORDANCE WITH AS/NZS 1260. DN100 PIPES SHALL BE CLASS SN4. DN150 TO DN375 PIPES SHALL BE CLASS SN8 WHERE THE DEPTH OF COVER TO THE TOP OF THE PIPE DOES NOT EXCEED 7.0m. WHERE THE DEPTH OF COVER TO THE TOP OF THE PIPE EXCEEDS 7.0m BUT IS LESS THAN 9.5m CLASS SN16 PIPES SHALL BE USED. WHERE THE DEPTH OF COVER TO THE TOP OF THE PIPE EXCEEDS 9.5m, ADVICE ON THE TYPE OF PIPE TO BE USED SHALL BE SOUGHT FROM THE INFRASTRUCTURE DEVELOPMENT BRANCH. PHONE 9420 2703.
   WHERE AVAILABLE CLASS SN8 MOULDED FITTINGS SHALL BE USED ON DN100 TO DN375 SEWERS WHERE THE DEPTH OF COVER TO THE TOP OF THE PIPE DOES NOT EXCEED 7.0m. WHERE MOULDED FITTINGS ARE NOT AVAILABLE FITTINGS SHALL BE FABRICATED FROM CLASS SN8 PIPE AND FIBREGLASS WRAPPED. WHERE THE DEPTH OF COVER TO THE TOP OF THE PIPE DOES EXCEED 7.0m FITTINGS SHALL BE EITHER CLASS SN8 MOULDED FITTINGS FIBREGLASS WRAPPED OR FITTINGS FABRICATED FROM CLASS SN16 PIPE AND FIBREGLASS WRAPPED.
3. PIPE INSTALLATION SHALL BE TO A.S. 2032 UNLESS SHOWN OTHERWISE.
4. PVC SEWER PIPES SHALL NOT BE RESTRAINED BY RIGID CONNECTIONS OR COVERED WITH BACKFILL UNTIL THE PIPE TEMPERATURE IS WITHIN THE OPERATING RANGE OF WASTEWATER TEMPERATURES FOR THE AREA.
5. PIPES SHALL BE CONSTRUCTED WITH THE SOCKET FACING UPSTREAM.
6. OVER EXCAVATION OF THE TRENCH BOTTOM SHALL BE BACKFILLED WITH APPROVED UNDERLAY MATERIAL AND COMPACTED TO THE EQUIVALENT OF THE SURROUNDING UNDISTURBED SOIL.
7. BEDDING MATERIAL:
   SAND FOR PIPE UNDERLAY, SIDE SUPPORT AND OVERLAY SHALL BE NATURAL SAND FREE FROM ROCK OR SHARP OBJECTS THAT WOULD BE RETAINED ON A 13.2mm TEST SIEVE.
   AGGREGATE FOR PIPE UNDERLAY SHALL BE 14mm NOMINAL SIZE COARSE AGGREGATE GRADED TO A.S. 2758.
8. BEDDING CONDITIONS:
   DRY TRENCH CONDITIONS SHALL APPLY WHEN TRENCH BOTTOM IS FREE FROM STANDING OR RUNNING WATER.
   WET TRENCH CONDITIONS SHALL APPLY WHEN TRENCH BOTTOM IS STABLE BUT NOT FREE FROM STANDING OR RUNNING WATER.
   WHERE TRENCH BOTTOM IS UNSTABLE, PILE AND KEEL OR PILE AND HAUNCHING SHALL BE USED.
9. PIPE SHALL BE UNIFORMLY SUPPORTED BY THE PIPE UNDERLAY MATERIAL.
10. CONCRETE ENCASEMENT:
    PIPES SHALL BE ENCASED WHERE SHOWN ON THE RETICULATION PLANS
11. BACKFILL:
    (a) BACKFILL MATERIAL SHALL BE SAND UNDER ALL TRAFFICABLE PAVED AREAS (INCLUDING GRAVEL AND LIMESTONE SURFACES). ELSEWHERE MATERIAL FREE FROM ROCKS LARGER THAN 200mm DIAMETER AND EXTRANEOUS MATERIAL.
    (b) THE FINAL 200 OF BACKFILL MATERIAL SHALL BE SIMILAR TO MATERIAL REMOVED DURING EXCAVATION OF THE TOP 200 OF TRENCH.
12. PILES SHALL BE DRIVEN TO 600 MIN. DEPTH BELOW THE EXCAVATION LINE AND TO A MAXIMUM SET OF 25mm WITH 14 BLOWS OF A 32 kg DOLLY FREE FALLING 1.0m.
13. COMPACTION:
    (a) PIPE UNDERLAY MATERIAL IN WET AND DRY TRENCHES SHALL BE COMPACTED WITH 2 PASSES OF A VIBRATORY PLATE COMPACTOR HAVING A MINIMUM STATIC MASS OF 50 kg.
    (b) SIDE SUPPORT MATERIAL SHALL BE PLACED IN 75mm LAYERS AND COMPACTED BY A HAND HELD RAMMER OR BY OTHER MEANS APPROVED BY THE ENGINEER.
    (c) COMPACTION FOR BACKFILL MATERIAL SHALL BE AS SPECIFIED IN THE SPECIFICATION.
14. TIMBER FOR PILES AND KEEL SHALL BE F8 JARRAH TO A.S. 2082.
15. CONCRETE SHALL BE GRADE N20 TO A.S. 3600.
16. REINFORCING STEEL SHALL BE TO A.S. 1302.
17. 'D' IS THE OUTSIDE DIAMETER OF THE PIPE BARREL.
18. CEMENT MORTAR BY VOLUME SHALL BE: 1 PART CEMENT TO 3 PARTS SAND.
19. VOIDS IN COARSE AGGREGATE UNDERLAY SHALL BE FILLED WITH SAND.



NOTE: TIE BARS TO BE Y12 BARS AT 250 CRS.

DIAMETER OF PIPE	KEEL SIZE	REINFORCING STEEL

GENERAL NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETRES UNLESS SHOWN OTHERWISE.
2. ACCESS CHAMBER COVERS LOCATED CLOSE TO A KERB SHALL BE SQUARE TO THE KERB, ACCESS CHAMBER COVERS LOCATED CLOSE TO A BOUNDARY SHALL BE SQUARE TO THE BOUNDARY. ELSEWHERE ACCESS CHAMBER COVERS SHALL BE SQUARE TO THE LONGEST UPSTREAM SEWER. ACCESS CHAMBER COVERS SHALL OPEN AWAY FROM KERBS, FENCES AND OTHER OBSTRUCTIONS WHICH MAY HINDER OPENING.
3. LADDERS SHALL BE LOCATED TO SUIT THE ORIENTATION OF THE ACCESS CHAMBER COVER. WHERE PRACTICABLE LADDERS SHALL BE LOCATED ON THE WALL (NOT CONTAINING A DROP) OPPOSITE THE LONGEST UPSTREAM SEWER.
4. IN SITU CONCRETE SHALL BE CLASS N25 AND PLACED IN ACCORDANCE WITH AS 3500 UNLESS OTHERWISE SHOWN.
5. BRICKS SHALL BE STANDARD SIZE 230 x 110 x 76.
6. CEMENT MORTAR BY VOLUME SHALL BE: 1 PART CEMENT & 3 PARTS SAND.
7. TIMBER SHALL BE F8 JARRAH TO AS 2082
8. PILES SHALL BE DRIVEN TO 600 MIN. DEPTH BELOW THE EXCAVATION LINE AND TO A MAXIMUM SET OF 25mm WITH 14 BLOWS OF A 32kg DOLLY, FREE FALLING 1m.
9. CENTRE POINT OF ACCESS CHAMBERS SHALL BE ON THE INTERSECTION POINT OF SEWERS.
10. A VERTICAL SURCHARGE, NOT EXCEEDING 90 kN, MAY BE APPLIED TO ACCESS CHAMBER SEGMENTS TO ACHIEVE INSTANT WATER TIGHTNESS.
11. BASE JOINT PROFILE FORMING:
    (a) BASE JOINT PROFILE SHALL BE CONSTRUCTED USING A BASE JOINT PROFILE FORMING RING.
    (b) JOINT FACE SHALL BE FINISHED TO STEEL TROWEL FINISH BY ROTATION OF FORMING RING AT INITIAL SET.
    (c) JOINT FACE SHALL BE TREATED (AS NECESSARY) TO REMOVE IRREGULARITIES PRIOR TO APPLICATION OF A JOINT PRIMER. TOLERANCE ON JOINT FACE ±1.5mm.
    (d) BASE JOINT FACE SHALL BE THOROUGHLY CLEANED BY BRUSHING WITH A STIFF BRUSH AND WIPED CLEAN PRIOR TO APPLICATION OF A JOINT PRIMER. (APPLIED AS PER MANUFACTURER'S SPECIFICATION).
    (e) PRIMER SHALL BE APPLIED NO SOONER THAN EIGHT HOURS AFTER INITIAL SETTING OF BASE SLAB.
    (f) PRIMED JOINT SHALL BE WIPED CLEAN PRIOR TO FITTING SEALING STRIP AS SHOWN ON JOINT DETAIL - TYPICAL FOR ALL JOINTS.
12. 'RELPATCH' MORTAR IS AVAILABLE FROM ROCLA RESOURCES.
13. REINFORCING STEEL IN BASES SHALL BE TO AS 1302.
14. REINFORCING FABRIC IN BASES SHALL BE TO AS 1304.
15. ACCESS CHAMBERS SHALL BE INSTALLED IN ACCORDANCE WITH MANUFACTURER'S INSTRUCTIONS.
16. CONVERSION SLAB SHALL BE MARKED TO IDENTIFY MANUFACTURER, MARK SHALL BE VISIBLE AFTER ACCESS CHAMBER IS CONSTRUCTED.
17. FIXING RING TO HAVE 'F' IMPRINT ON INTERNAL FACE.
18. THE RADIUS OF THE CENTRE LINE OF THE CHANNEL SHALL BE THE MAXIMUM PRACTICABLE AND SHALL BE A MINIMUM OF 285
19. ALL HOLES IN ACCESS CHAMBERS FOR DN150 AND DN225 PVC PIPE INLETS AND OUTLETS SHALL BE EITHER BORED OR CORED.
20. ONLY ACCESS CHAMBERS AND ACCESS CHAMBER COMPONENTS ACCEPTED BY THE WATER CORPORATION SHALL BE USED. THIS DRAWING IS AN EXAMPLE DRAWING, THE DETAILS OF SOME ACCEPTED ACCESS CHAMBERS MAY VARY FROM THOSE SHOWN ON THE DRAWINGS.
21. ALL ACCESS CHAMBER SEGMENTS SHALL BE MANUFACTURED AND TESTED IN ACCORDANCE WITH AS4198.

SECTION B

GENERAL NOTES :

1. ALL DIMENSIONS ARE IN MILLIMETRES UNLESS SHOWN OTHERWISE.
2. PIPE INSTALLATION SHALL BE TO A.S. 2032 UNLESS SHOWN OTHERWISE.
3. PVC SEWER PIPES SHALL NOT BE RESTRAINED BY RIGID CONNECTIONS OR COVERED WITH BACKFILL UNTIL THE PIPE TEMPERATURE IS WITHIN THE OPERATING RANGE OF WASTEWATER TEMPERATURES FOR THE AREA.
4. OVER EXCAVATION OF THE TRENCH BOTTOM SHALL BE BACKFILLED WITH APPROVED UNDERLAY MATERIAL AND COMPACTED TO THE EQUIVALENT OF THE SURROUNDING UNDISTURBED SOIL.
5. BEDDING MATERIAL:
   SAND FOR PIPE UNDERLAY, SIDE SUPPORT AND OVERLAY SHALL BE NATURAL SAND FREE FROM ROCK OR SHARP OBJECTS THAT WOULD BE RETAINED ON A 13.2mm TEST SIEVE.
   AGGREGATE FOR PIPE UNDERLAY SHALL BE 14mm NOMINAL SIZE COARSE AGGREGATE GRADED TO A.S. 2758.1.
6. BEDDING CONDITIONS:
   DRY TRENCH CONDITIONS SHALL APPLY WHEN TRENCH BOTTOM IS FREE FROM STANDING OR RUNNING WATER.
   WET TRENCH CONDITIONS SHALL APPLY WHEN TRENCH BOTTOM IS STABLE BUT NOT FREE FROM STANDING OR RUNNING WATER.
   WHERE TRENCH BOTTOM IS UNSTABLE, PILE AND KEEL OR PILE AND HAUNCHING SHALL BE USED.
7. PIPE SHALL BE UNIFORMLY SUPPORTED BY THE PIPE UNDERLAY MATERIAL.
8. BACKFILL:
   (a) BACKFILL MATERIAL SHALL BE SAND UNDER ALL TRAFFICABLE PAVED AREAS (INCLUDING GRAVEL AND LIMESTONE SURFACES) AND EXCAVATED MATERIAL ELSEWHERE FREE FROM ROCKS LARGER THAN 300mm DIAMETER AND EXTRANEOUS MATERIAL.
   (b) THE FINAL 300 OF BACKFILL MATERIAL SHALL BE SIMILAR TO MATERIAL REMOVED DURING EXCAVATION OF THE TOP 300 OF TRENCH.
9. COMPACTION:
   (a) PIPE UNDERLAY MATERIAL IN WET AND DRY TRENCHES SHALL BE COMPACTED WITH 2 PASSES OF A VIBRATORY PLATE COMPACTOR HAVING A MINIMUM STATIC MASS OF 50 kg.
   (b) SIDE SUPPORT MATERIAL SHALL BE PLACED IN 75mm LAYERS AND COMPACTED BY A HAND HELD RAMMER OR BY OTHER MEANS APPROVED BY THE ENGINEER.
10. VOIDS IN COARSE AGGREGATE UNDERLAY SHALL BE FILLED WITH SAND.
11. REFER TO AA01-11A-1 FOR CONCRETE ENCASEMENT AND BEDDING IN UNSTABLE CONDITIONS.
12. ONLY MAINTENANCE SHAFTS ACCEPTED BY THE WATER CORPORATION SHALL BE USED.
13. MAINTENANCE SHAFTS SHALL BE USED WHERE SHOWN ON THE DESIGN PLANS.
14. MAINTENANCE SHAFT NUMBER TO BE ENGRAVED ON 150 x 50 PLASTIC EXTERIOR ENGRAVING LAMINATE. LAMINATE TO BE 1.5mm THICK WHITE OVER BLACK. LETTERS TO BE 30mm HIGH. ENGRAVING TO BE 4mm WIDE.
15. LONG RADIUS BENDS
    (a) DN150 PIPE BENDS SHALL BE 600-750mm RADIUS.
    (b) DN225 PIPE BENDS SHALL BE 1450mm RADIUS.
    (c) AFTER BENDING, MINIMUM WALL THICKNESS OF PIPE SHALL BE IN ACCORDANCE WITH CLASS SN8 PIPE TO AS/NZS 1260.
    (d) BENDS SHALL BE SHOP MANUFACTURED BY APPROVED PIPE SUPPLIERS OR THEIR NOMINATED SUB-CONTRACTORS.
    (e) FABRICATED LOBSTER BACK BENDS AND SHORT RADIUS BENDS (ELBOWS) SHALL NOT BE USED.

6. ALL FITTINGS SHALL HAVE SOCKET JOINTS AT ALL CONNECTIONS AND THE MINIMUM DISTANCE BETWEEN THE FACES OF THE SOCKETS SHALL BE 100mm UNLESS SHOWN OTHERWISE.
7. DIMENSION ≥ SHALL BE 7m IN ROAD RESERVES AND 1m IN RIGHT OF WAYS UNLESS SHOWN OTHERWISE.
8. JUNCTIONS SHALL BE 2m MINIMUM APART EXCEPT AT THE END OF I.O SEWERS AND I.S. SEWERS WHERE THEY SHALL BE 1m APART MINIMUM UNLESS SHOWN OTHERWISE.
9. PUSH ON CAPS MAY BE REQUIRED TO BE REMOVED AND REPLACED AT THE CONTRACTOR'S EXPENSE FOR INSPECTION PURPOSES
10. IF PROPERTY CONNECTION IS LESS THAN 1m DEEP TO INVERT USE RUNNING TRAP TYPE BOUNDARY TRAP, REFER DRAWING AA01-G1-2.
11. DOUBLE RISING SHAFT PROPERTY CONNECTIONS SHALL ONLY BE USED WITH PRIOR WATER CORPORATION APPROVAL WHERE IT IS CONSIDERED IMPRACTICABLE TO GRADE THE PROPERTY CONNECTION DOWN TO THE RETICULATION SEWER BECAUSE OF HARD ROCK, RESTRICTED WORK AREAS AND WHERE OBSTRUCTIONS HAVE TO BE AVOIDED. DOUBLE RISING SHAFT CONNECTIONS SHALL ONLY BE USED IN SHORED TRENCHES WHERE THE SHORING HAS BEEN INSTALLED TO PROTECT STRUCTURES.
12. SHAFT SUPPORT MAY BE OMITTED BUT THE MAXIMUM LENGTH OF UNSUPPORTED RISING SHAFT SHALL NOT EXCEED 3m.
13. PILING IS NOT REQUIRED IF THE TRENCH BACKFILL / UNDERLAY HAS BEEN COMPACTED TO 95% DRY DENSITY RATIO IN ACCORDANCE WITH AS 1289.5.4.1

GENERAL NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS UNLESS OTHERWISE SHOWN.
2. HOLES FOR FIXING INTO CONCRETE WORK SHALL BE SITE DRILLED WITH STEELWORK IN POSITION.
3. ALL STAINLESS STEEL (SS) SHALL BE A.I.S.I.:
   - SS PLATE, SHEET AND STRIP SHALL COMPLY WITH ASTM A480M GRADE 316L
   - SS FASTENERS SHALL COMPLY WITH ASTM A276 GRADE 316.
   - SS BARS SHALL COMPLY WITH ASTM A276 GRADE 316L.
   - SS PIPE SHALL COMPLY WITH ASTM A321M GRADE 316.

   CONSUMABLES SHALL COMPLY WITH A.I.S.I 3161 SI. AFTER WELDING ALL WELD SPLATTER AND OXIDE SHALL BE REMOVED AND WELDS PICKLED AND PASSIVATED.
4. DUCTILE IRON PIPE FITTINGS SHALL BE TO AS/NZS 2280 AND SHALL BE THERMAL BONDED POLYMETRIC COATED INTERNALLY AND EXTERNALLY TO AS/NZS 4158.
5. DN10 BRONZE GATE VALVES AND BRASS HEXAGONAL NIPPLES SHALL BE FIXED TO PIPES AS SHOWN.
6. UNI-FLANGE PRODUCTS AVAILABLE FROM 'TYCO WATER' OR 'DOBBIE DICO'.
7. ALTERNATIVE PROPRIETARY PRODUCTS OR BRANDS MAY BE USED IF ACCEPTED BY THE WATER CORPORATION.
8. KNIFE GATE VALVE SHALL BE TYCO F952-180 STAINLESS STEEL KNIFE GATE VALVE, VITON 'O' RING, LUGGED BODY, RISING SPINDLE, EXTENSION TUBE AND STAINLESS STEEL SQUARE DRIVE, ANTI-CLOCKWISE CLOSING (ACC) TO SPS 259. AVAILABLE FROM TYCO FLOW CONTROL, 19 LEADERSHIP WAY, WANGARA, WA 6065
9. UNLESS SHOWN OTHERWISE METALLIC FLANGED JOINTWORK INCLUDING NUTS AND BOLTS SHALL BE FIELD-WRAPPED BY A PROTECTION SYSTEM COMPRISING 'DENSO 600' TAPE AND 'DENSO 901' OVERWRAP TAPE OR APPROVED EQUIVALENT.
10. PUMPSET LIFTING CHAINS SHALL BE TO AS 2321, SHACKLES TO BE TO AS 2741 AND LIFTING COMPONETS TO BE TO AS 3776.
11. ALL FASTENERS SHALL BE STAINLESS STEEL TYPE 316 TO ISO 3506 UNLESS OTHERWISE SPECIFIED.
12. FASTENERS USED IN CONJUNCTION WITH POLYMERIC COATINGS SHALL BE STAINLESS STEEL AND HAVE A STAINLESS STEEL FLAT WASHER FITTED UNDER THE BOLT HEAD AND NUT.
13. FASTENERS USED IN CONJUNCTION WITH MSCL FLANGES SHALL BE HOT DIP GALVANIZED TO AS 1214 AND THE FLANGES SHALL BE 'DENSO' WRAPPED.
14. COPPER ALLOY FITTINGS SHALL BE TO AS 3688 AND AS 2345.
15. ALL FLANGES TO BE AISI GRADE 316L STAINLESS STEEL UNLESS OTHERWISE SHOWN.
16. FLOAT SWITCHES TO BE FLYGT ENH-13 OR EQUAL APPROVED.
17. TAPPING POINTS SHALL BE A MINIMUM OF TWO PIPE DIAMETERS DOWNSTREAM OF ELBOW.
18. PUMPSET SHALL BE SUPPLIED IN ACCORDANCE WITH WATER CORPORATION SPS 503.
19. *Pump base plate fixing anchor ('Hilti' Hkd) length and diameter to be in accordance with pump supplier's specification. Design Engineer to determine this requirement and amend drawing accordingly.*
20. *Conduit sizes and arrangement shall be confirmed by the Design (Electrical) Engineer.*
21. *Designer to ensure that pumps can be installed through cover opening*
22. *Designer to check with the Water Corporation, if a Magnetic Flow Meter is required.*

GENERAL NOTES

1. ALL DIMENSIONS ARE IN MILLIMETERS UNLESS OTHERWISE SHOWN.
2. BOTTOM OF EXCAVATION SHALL BE LINED WITH 150mm OF NATURAL SAND AND COMPACTED WITH AT LEAST FOUR PASSES OF A VIBRATING PLATE COMPACTOR HAVING A MINIMUM STATIC MASS OF 50 kg.
3. BACKFILL AROUND PUMP WELL SHALL BE PLACED IN LAYERS NOT EXCEEDING 300mm LOOSE THICKNESS AND COMPACTED UNIFORMLY WITH FOUR PASSES PER LAYER OF A VIBRATING PLATE COMPACTOR HAVING A MINIMUM STATIC MASS OF 50 kg OR AS DIRECTED.
4. BACKFILL BELOW INLET PIPE AND VALVE PIT SHALL BE COMPACTED TO AT LEAST 8 BLOWS / 300mm WITH A STANDARD PERTH PENETROMETER OR 95% MODIFIED AASHO. WHERE THIS CANNOT BE ACHIEVED INLET PIPE SHALL BE SUPPORTED ON PILE AND KEEL AND VALVE PIT ON PILES AND BEARERS AS DIRECTED BY THE SUPERINTENDENT.
5. THE EMPTY PUMPING STATION WELL IS SAFE AGAINST FLOTATION WHEN GROUND WATER LEVEL IS AT FINISHED GROUND LEVEL PROVIDING BACKFILL HAS BEEN COMPLETED *(Design Engineer to Confirm)*
6. ALL PUMPING STATION SEGMENTS SHALL BE MANUFACTURED AND TESTED IN ACCORDANCE WITH AS 4058.
7. ALL CONCRETE SHALL BE SULPHATE RESISTANT CONCRETE WITH A STRENGTH OF 40 MPa AT 28 DAYS. INTERNAL FINISH SHALL BE SMOOTH TO AS 1510 CLASS 2. (USE CALCAREOUS AGGREGATE FOR SEWAGE OR EFFLUENT USE).
8. STEEL REINFORCEMENT SHALL COMPLY WITH AS 1302 & AS 1304
9. ALTERNATIVE PROPRIETARY PRODUCTS OR BRANDS MAY BE USED IF ACCEPTED BY THE WATER CORPORATION.
10. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE STABILITY OF THE PUMPING STATIONS PRECAST COMPONENTS DURING ALL TEMPORARY CONDITIONS. IN PARTICULAR, UNLESS OTHERWISE APPROVED, THE CONTRACTOR SHALL EMPLOY DEWATERING AS APPROPRIATE AND SHALL TAKE PRECAUTIONS TO PREVENT FLOTATION IN CASE OF FAILURE OF THE DEWATERING SYSTEM AT ALL STAGES OF CONSTRUCTION UNTIL THE SOIL HAS BEEN BACKFILLED TO THE GROUND LEVEL SHOWN AND THE TOP SLAB PLACED ON TOP OF THE SEGMENTS.
11. LIFTING DETAILS:- 3 x 5.0t SWIFT-LIFTS' IN BASE. 4 x 5.0t ON INTEGRAL VALVE CHAMBER & COVER SLAB, AND 3 x 1.3t ON INTERMEDIATE INCREMENTS *(Design Engineer to Confirm)*

APPENDIX G

RECYCLED WATER ASSET LIST AND DESIGN

Monday, 13 December 2010

Port Bouvard Limited
Level 2, 129 Melville parade
Como
WA 6952

Attention: Jeff Strahan

Non Potable Water Supply
Point Grey
Discussion Purposes only

Thank you for the opportunity to submit a brief for recycled water re use system to be installed into 3,500 lots at Point Grey. It is anticipated that a demand of 30 to 50 LPM @ 300KPA will be required at each lot; This supply will also irrigate 20 HA POS

The proposed system will be controlled by a central control system and will activate upon a signal from either the bores or the treatment plant

Its anticipated water will be available for the lots between 10.00pm & 1.00am as nominated on there watering days and the parks between 10.00pm &` 6.00AM daily (this will vary depending on storage capacity and usage)

Water Supply

Two artesian water bore's will be installed for potable water use and as a temporary measure to irrigate the POS.

Description of Work

Mobilisation and demobilisation of all plant and equipment.
1 x 200mm Bore
Drilling of bores
Supply and installation of all materials and equipment.
Sampling, testing, labelling and reporting.
Compilation and submission of drilling/bore logs as required by the Department of Water.
Gravel packing.
Development of Bore.

Bore Diameter & Depth
The depth of the bore hole will be **80 (estimated)** Metres and will be a suitable diameter for the installation of the bore casing, stainless steel screen and a minimum of 50mm gravel packed annulus surrounding the screen.

Bore Alignment & Drilling Method
The rotary method of drilling will be used to install the bore, which shall be installed within a vertical gradient of 1:300 over the depth of the bore hole.

Bore Casing, Screen, Grout & Gravel Pack
200NB PVC CLASS 12 bore casing will be installed in the bore. The casing and screen installed has been fitted with casing centralisers spaced no further than 12 metres apart.

12 metre stainless steel wedge-wire screen, being of a 200NB IN-LINE design (219mm OD), fabricated using stainless steel Grade 304 material of standard duty construction will be installed in the bore with a casing adaptor/packer and stainless steel base plate.

Water Analysis
One sample of the bore water pumped from the bore at the conclusion of the test shall be taken and submitted to an accredited laboratory for water analysis including pH, electrical conductivity (EC), total dissolved salts, bicarbonates, hardness, alkalinity, sodium, calcium and dissolved carbon dioxide.

Development
The bore will be developed using compressed air.

Test Pumping

- Test Flow Rate: 54 cubic metres of water per hour
- Pumping level: 40 metres from natural ground level.

Pump

Bore Pump & Shroud
The submersible bore pumps are of 150mm nominal diameter of non-corrosive construction, having a performance of approximately **12** Litres per second at a total head of **55** Metres

A Grundfos model SP 46-7 11 KW Grundfos three phase (415VAC) submersible pump/motor shall be 316 Stainless Steel units will be installed in the bore, with a pump shroud.

Grundfos pumps are authorised submersible electric borehole motor supply to Water Corporation installation except for area as per the Water Corporation Product atlas.

Discharge Column & Ancillaries

The pumps have been installed on 80mm Permaglass rising main; this will be installed as per manufactures specification Sufficient column will be installed so that the top of the pump is a minimum of three(**3**) metres below the duty dynamic water level, but for tendering purposes, an allowance of **45** metres of pump column and ancillaries has been allowed for.
The electrical drop cable installed within the bore, connecting to the pump motor, is designed by the manufacturer for permanent submergence in water (Hydro firm or Aqua flex) A PVC 20mm probe conduit, stainless steel safety cable and permanent 6mm nylon draw-down tube shall be installed and terminate at the bore head junction boxes as shown in the drawings. The probe conduit and nylon draw-down tube shall terminate at the top of the pump unit.

Discharge Flange & Assembly
The discharge flange and discharge assembly has been manufactured entirely of 100mm steel (Schedule 40) pipe and fittings and shall be hot-dip galvanised after fabrication.
The discharge assembly including a metal vacuum breaker (sniffer) valve, and wafer check valve, test tee with blind flange, pressure tube tapping, dual junction boxes, and butterfly isolation valve. The discharge flange and assembly shall be mounted on a concrete support block being of minimum dimensions of 750 x 750mm with a depth of 600mm deep.

Magflow

Each bore will be equipped with two 100mm Magflow meters;

Electrical

Electrical Controls for Bore

SYSTEM OVERVIEW

The following system overview encompasses both the Slave and Master cubicles.

The system comprises of one Master Bore cubicle and One Slave cubicle. The Master Bore Cubicle will control a local bore including all fault detection, monitoring and indication as well as monitor and control of all the Slave Bore Cubicles.

The Slave Bore Cubicle will send, to the Master Bore Cubicle, and respond to the pressure transducer and Mag flow outputs, thus enabling the speed of the system to be controlled via both flow and pressure outputs. The information sent to the Master will be done via remote telemetry units located in each Slave Bore Cubicle. Each Slave Bore Cubicle is to be equipped with low level, high pressure and low pressure protection with fault indication and lock out relays.

The Master Bore Cubicle will house the Master Control Unit (Braig 2004) which will monitor and control all Slave and Maser Bore cubicles. The MCU will rotate the Slave pump duties and alternate the pump start sequence in order to keep wear down to a minimum and allow for uninterrupted system operation while pumps are being serviced or repaired.

The pump system is to operate between a preset period of time, whereupon the system will incorporate a ramp-up and start-up sequence controlled via the MCU. This will enable the system to start-up and slowly pressurise to the operating pressure, thereafter it will act as a pressurised system until switched off. The ramp-up and start-up sequence is to be controlled so as to eliminate water hammer and surges to within acceptable limits.

The MCU is to be able to monitor and log faults from both the local bore and the Slave Bore, enabling the operator ease of indication as to what and where the fault occurred.

The main cubicle will also collect all the relevant data from the weather station and water meters via telemetry all this information then will be sent to a pre determined computer.

Cubicle Construction

Each cubicle is a free standing aluminium enclosure of sufficient size to house all the required electrical equipment, including the Western Power meters. The cabinet shall be constructed of quality aluminium alloy (grade 5005/H34) of 2.5mm thickness. All seams has been welded and ground smooth.

SLAVE BORE CUBICLE

The following equipment is housed in the slave cubicle

Main isolator for Slave Bore Pump
Bore pump controls
Starter for bore pump
Wireless telemetry units.
Magflow and associated controls
Low level monitoring equipment
High and low pressure switches
Fault reporting and indication controls
All ancillary equipment required for the correct operation of the pump station
Cooling and ventilation equipment
Locks keyed to customer requirements

Motor Starter – Slave Bore Pump

This pump is controlled by a Danfoss variable speed drive coupled to a Danfoss pressure transducer in conjunction with a Magflow meter. The pump will attempt to maintain pressure by increasing or decreasing speed as necessary to meet the flow demand of normal irrigation. The flow rate will be monitored with feed back to the variable speed drive to enable the system to be controlled by a combination of flow and pressure.

The control system will provide for the fully automatic operation of the pumps in accordance with flow demand of the irrigation system, which is sensed via 4-20mA signal provided by the pressure transducer installed on the bore pump pressure distribution manifold within the electrical cabinet, together with a 4-20mA signal from the Magflow meter mounted in the bore line.

The Danfoss variable speed motor starter has been sized according to the maximum rated amperage draw of the pump (not the nominal power consumption), as published by the pump manufacturer and has been supplied and installed with appropriate RFI/EMI filters.

Ancillary Controls – Slave Bore Pump Protection

One (1) pressure switch to be configured to provide the irrigation system with protection form High Pressure damage, together with 1-10 second programmable timing delay, electrical “lock-out” of the main pump, visual indication of the high pressure fault and a reset button. The pressure switch set point shall be set midway between the pump’s shut off (no flow) pressure and normal operation pressure.

One (1) pressure switch to be configured to provide the irrigation system with protection form low mainline pressure condition, together with 1-10 minute programmable timing delay, electrical “lock-out” of the main pumps, visual indication of the low pressure fault and a reset button. The pressure switch set point shall be set at a suitable point below the normal operation pressure.
A key operated selector switch for each of the irrigation pumps with the following positions and functions

AUTO – the main pump is activated via a signal from the Master Control Cubicle controller (Braig 2004 or equivalent) installed within the electrical cubicle.
MANUAL – allows full bore cubicle operation without the presence of the “pump start” signal form the Master Control Cubicle. The variable speed drive pump is to have a manual speed control pot fitted.
OFF – the main pumps are isolated from all control signals.

Prohibit the operation of all pumps whilst there is no “pump start” signal being received from the Master control unit (Braig 2004).
A pressure gauge 0-1000 kpa (Glycerin filled), panel mounted.
Quadrant type ammeter 72mm minimum operated by current transformer for each pump.
A pump running lamp and system protection fault lamps for each pump.
Full radio frequency interference filtering to AS 2064 class B.
Fault lock out relays.
Hour run meter for each pump.
Circuit breaker protection for each pump.
Low frequency shut down with time base.
Phase failure relay protection.
Have a manual speed control on the panel for the variable speed pump.
Cooling fans and thermostat for adequate cooling of cubicle.
Low level sensing and lock-out relay (including fault indication).
Stainless steel level probes for all level controls.
RCD protected socket outlet.
Radio telemetry equipment.
Fault reporting processing unit.
Magflow meter display panel and associated equipment

MASTER BORE PUMP CUBICLE

The master cabinet has been built with the following equipment

Main isolator for Slave Bore Pump
Bore pump controls
Starter for bore pump
Wireless telemetry units.
Magflow and associated controls
Low level monitoring equipment
High and low pressure switches
Fault reporting and indication controls
All ancillary equipment required for the correct operation of the pump station
Cooling and ventilation equipment
Locks keyed to customer requirements

Motor Starter – Slave Bore Pumps

This pump is controlled by a Danfoss variable speed drive coupled to a Danfoss pressure transducer in conjunction with a Magflow meter. The pump will attempt to maintain pressure by increasing or decreasing speed as necessary to meet the flow demand of normal irrigation. The flow rate will be monitored with feed back to the variable speed drive to enable the system to be controlled by a combination of flow and pressure.

The control system will provide for the fully automatic operation of the pumps in accordance with flow demand of the irrigation system, which is sensed via 4-20mA signal provided by the pressure transducer installed on the bore pump pressure distribution manifold within the electrical cabinet, together with a 4-20mA signal from the Magflow meter mounted in the bore line.

The Danfoss variable speed motor starter has been sized according to the maximum rated amperage draw of the pump (not the nominal power consumption), as published by the pump manufacturer and has been supplied and installed with appropriate RFI/EMI filters.

Ancillary Controls – Slave Bore Pump Protection

One (1) pressure switch to be configured to provide the irrigation system with protection form High Pressure damage, together with 1-10 second programmable timing delay, electrical "lock-out" of the main pumps, visual indication of the high pressure fault and a reset button. The pressure switch set point shall be set midway between the pump's shut off (no flow) pressure and normal operation pressure.

One (1) pressure switch to be configured to provide the irrigation system with protection form low mainline pressure condition, together with 1-10 minute programmable timing delay, electrical "lock-out" of the main pumps, visual indication of the low pressure fault and a reset button. The pressure switch set point shall be set at a suitable point below the normal operation pressure.
A key operated selector switch for each of the irrigation pumps with the following positions and functions

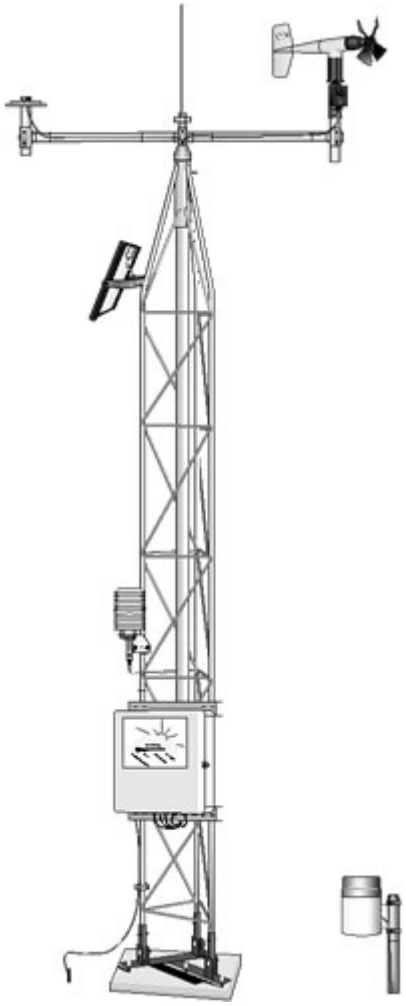
AUTO – the main pump is activated via a signal from the Master Control Cubicle controller (Braig 2004 or equivalent) installed within the electrical cubicle.
MANUAL – allows full bore cubicle operation without the presence of the "pump start" signal form the Master Control Cubicle. The variable speed drive pump is to have a manual speed control pot fitted.
OFF – the main pumps are isolated from all control signals.
Prohibit the operation of all pumps whilst there is no "pump start" signal being received from the Master control unit (Braig 2004).
A pressure gauge 0-1000 kpa (Glycerin filled), panel mounted.
Quadrant type ammeter 72mm minimum operated by current transformer for each pump.
A pump running lamp and system protection fault lamps for each pump.
Full radio frequency interference filtering to AS 2064 class B.
Fault lock out relays.
Hour run meter for each pump.
Circuit breaker protection for each pump.
Low frequency shut down with time base.
Phase failure relay protection.
Have a manual speed control on the panel for the variable speed pump.
Cooling fans and thermostat for adequate cooling of cubicle.
Low level sensing and lock-out relay (including fault indication).
Stainless steel level probes for all level controls.
RCD protected socket outlet.
Radio telemetry equipment.
Fault reporting processing unit.
Magflow meter display panel and associated equipment

Weather Station

A weather station will be installed this will control the watering cycles, the weather monitors the following.

Wind Speed
Temperature and Relative Humidity
Precipitation
Wind Direction

The MetData1 offers the flexibility of a custom system with the ease-of-use of a preconfigured system. The MetData1 provides seven connectors dedicated to sensors. Simply choose the sensor that you need for your application from the list that is available for each connector. Using our Visual Weather software you can specify which sensor you have for each connector. The MetData1 also offers multiple data retrieval options, tower/tripod options, and power supply options.



Features

- Automated weather station designed for standard meteorological applications; can be customized with available sensors
- Sensor connectors mate to connectors on outside of the enclosure; additional sensor wiring is not required
- Configured using Visual Weather Software
- Cross arm assembly with sensor cables routed internal to the cross arm also available
- Tripod or tower options include our CM6 6-foot tripod, CM10 10-foot tripod, or UT10 10 foot tower
- Data telemetry options include telephone, short haul modems, MD9, and voice-synthesized modems

The MetData1 uses an "-LC" version of our sensors, which feature specialized connectors for interfacing to the measurement and control electronics. With the exception of these connectors, the specifications for the sensors are identical to the versions found in our the sensors section of the web site. For all -LC sensors, the lead length is entered in feet after the LC. Sensor mounts for our tripods and 3 meter tower are listed in the individual sensor sections.

Pipework

System Layout

The system layout includes a network of Lilac PVC pipework underground with isolation valves installed at certain locations these can be used to isolate parts of Village 4 if required.

All underground piping shall be PVC piping manufactured to Australian Standard 1477.1 - 1988. Tenderers shall state in the product schedule the make of piping to be used.
All mainlines are uPVC manufactured in Australia to AS1477-1999 and utilise the Rubber Ring method of Jointing (RRJ) these pipes are lilac in colour and class 12
Mainlines have been installed with 600mm minimum soil cover, and shall be bedded and backfilled in accordance with this specification.
Where mainlines have been installed under unsealed driveways or other unsealed trafficable areas, they shall be installed with a minimum soil cover of 600mm.

Thrust Block

Thrust blocks will be constructed in accordance with the pipe manufacturer's installation instructions and shall be constructed symmetrically about the centre line of fitting.
The pipe or fittings shall be covered with a protective membrane of PVC when adjacent to concrete.
Concrete shall be thoroughly mixed on the surface prior to installation.
Concrete thrust blocks will be poured as required depending on the site conditions. Size and locations shall be determined on site and suit the ground conditions, but it can be assumed that thrust blocks shall have minimum dimensions of approximately 600 x 600 x 600mm.
Thrust blocks shall be installed on all RJ mainline fittings, including elbows, bends, reducers, tees and isolation valves and above, but excluding 'self straining' take-offs such as tapping bands for air valves and tees to solvent welded branches for sub-mains.
Thrust blocks shall be so placed that the pipe joint will be accessible for inspection and repair.
Concrete for thrust blocks shall be placed against undisturbed soil faces. All sides of thrust blocks not in contact with undisturbed soil shall be formed.

Valve Boxes

Valve boxes shall be left flush with the surrounding infrastructure and shall be manufactured from cast iron and of the conical type.

Isolation Valves

Mainline isolation points shall be achieved by installing wafer valves at mainline connection points and all mainline branches. These valves will be housed in valve boxes these valves will be rated to a working pressure of 1400kPa.
A label will be attached t the isolation valve location stating

NON POTABLE WATER
NOT TO BE USED FOR HOUSE CONNECTION
IRRIGATION USE ONLY

Air Valves

We shall allow to supply and install 50 mm dual air release valves or approved equivalent on 40 mm O ring articulated risers connected to the existing or new mainline via bronze female iron screwed tapping saddles. The locations of these air valves shall be such that any trapped air in the mainline is able to be readily exhausted whilst minimising the risk of water hammer in the system. These valves shall be fitted with a Johns 59M or approved equivalent isolating gate valve to permit isolation of the air valve for maintenance purposes.

Meters POS

Each POS will have either a 80mm or 100mm water meter installed as per detail

Lot Connections

These have been done with MDPE PN 10, 25mm poly pipe size as shown on plan.
All lot connection all pipes have been installed with 400mm minimum soil cover, and shall be bedded and backfilled in accordance with this specification.
A 30 LPM or a 50 LPM orifice plate will be installed prior to the isolation and master valve.
The flow will be recorded via the use of a 20mm water meter with a 4-20m output and a Water Flow irrigation controller located on the house (Controller Price in House and land packages)

Please do not hesitate to contact Bruce Scarterfield or Jason Hodgson for any further information relation to this proposal
Regards
